## Snap-in tracks Improved rails

For **kits and panels** you can choose for **load security** between **lashing bars, airline tracks and snap-in tracks**.

The proven MA280137 and MA 280017 **snap-in tracks** can be used universally. They are recessed in the walls.

Various lashing straps can be fastened here and locking bars anchored.

### The new snap-in tracks

MA280147.001 and MA280147.002 are a further development of the known rails. In addition to the previous possibilities, they offer you some advantages.

They are made of a **higher strength steel**. This is coated on both sides with an alloy of zinc, aluminum and magnesium.

This makes them significantly **more corrosion resistant** than the otherwise galvanized or strip galvanized rails. They also exhibit improved adhesion properties to the walls. This gives the user **greater security against body damage** in the event of faulty load securing.

You benefit twice, because you get the rails with the described advantages **at no extra charge**. **By the way, you can recognize the new combi anchor channels by the more uniform, slightly darker surface compared to conventional versions.**
