Swap body bolster: Program revised

Our tried and tested kits are ideal for creating swap systems. For very individual requirements, there are **swap body bolster** for the usual container lengths and up to **4 parking levels of 1,020 - 1,320 mm** for welding in. We are currently revising the corresponding programme. It now includes both the height-adjustable and the rigid swap body bolsters.

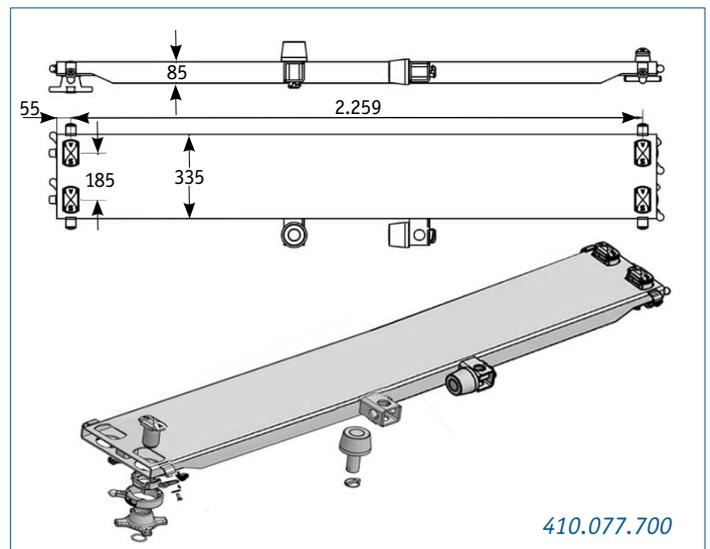

All components that you weld are **supplied in raw**, the **moving parts** of the height adjustment are **hot-dip galvanized**. On request, you can get the swap body bolster with recessed or welded-on guide roller holders.

The **height-adjustable swap body bolster** include **three lift-lock types** as well as **countless swivelling variations**, which we configure for you, tailored to the application.

In the range of **rigid bolsters** with single or double twist locks, **the bolster 410.077.700** is a **new addition** for transporting different container lengths flush with the cab:

You will find a data sheet for each bolster on our website, now also with the respective spare parts for servicing.

You can also use **the product overview for Schneider swap body bolster:**
