Swap body bolster with double twist locks: Always flush with cab

For applications where **swap system kits** are not used, Schneider offers **rigid bolsters** for welding.

For transporting different container lengths flush with the cab, these are equipped **with double twist locks**. This is particularly important for vehicle combinations with center axle or turntable trailers.

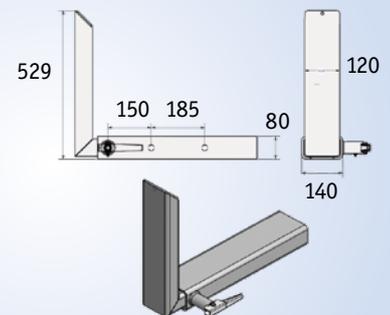

For even more flexibility you can get alternatively BDF bolsters **with lift-lock height adjustment** or **with rotating locking heads**.

Schneider BDF bolsters cover the usual container lengths and **up to 3 parking levels of 1,020 - 1,220 mm or 1,120 - 1,320 mm**. On request, they are available with integrated or welded-on guide rollers.

To protect the driver's cab, there is a front stop for welding on.

It can be adjusted to three positions with a spring locking bar.
